“บำรุงอย่างเป็นธรรมชาติ: คุณค่าออร์แกนิกบริสุทธิ์”

FAOS

น้ำมันมะกอกและน้ำผึ้ง ถือเป็นทองคำแห่งธรรมชาติ บริสุทธิ์ เป็นธรรมชาติ และเต็มไปด้วยคุณสมบัติในการเพิ่มคุณค่าชีวิต

ผลิตภัณฑ์ออร์แกนิคบริสุทธิ์ ECO-System 100% (ชีวิตสุขภาพดี)

(การดูแลอาหารทางการแพทย์ของคุณ)

FAOS Premium Organic Collection – Premium Olive Oil and Real Honey

This presentation's objective is to introduce to the reader the magical world of Our Extra Virgin Olive Oils and High Premium Honeys.

Our goals are to educate the consumer about all the processes involved, the technical and organoleptically characteristics of these exceptional foods that earth so abundantly gives us. Also, to present our premium organic products made exclusively from us and from a few farmer friends.

EXTRA VIRGIN OLIVE OIL

Olive oil, a must in Mediterranean cuisine and a core component of healthy diets worldwide, it's the most well recognised oil in the world for centuries.
Its rich, buttery flavor and numerous potential health benefits have made this golden tonic an important ingredient.
While the basic process of olive oil production remains consistent across different varieties, subtle variations in cultivation, harvesting, and processing techniques can significantly impact the final product's quality, taste, and nutritional value.
Each variety type, with its unique characteristics, offers distinct sensory pleasures and health-related benefits.

Basics of Olive Oil

To produce olive oil, olives are harvested and then crushed into a paste. This paste is mixed with water and subjected to a mechanical pressing process known as **cold pressing.**
This traditional method minimizes the use of heat, preserving the oil's delicate flavor profile and nutritional content.
Olive oil is a liquid of extremely beneficial fat, extracted from olives, the fruit of the **Olea europaea tree.**

The resulting mixture separates into three layers consisting of oil, water, and solid matter. The oil, being less dense than water, rises to the surface and is carefully extracted.
The process of making Greek olive oil is deeply rooted in **centuries-old techniques,** ensuring the preservation of the oil's unique flavor and aroma.
Similar to other olive oil production methods, Greek olive oil is made through a process involving harvesting, crushing, and pressing.
However, Greece boasts a diverse range of exceptional olive cultivars, each contributing to the unique characteristics of its olive oil.

Basics of Olive Oil

- **Unique Ancient Local Varieties:** Olive oils such as Olympia, Athinolia, Manaki, and **KORONEIKI** are made from unique ancient local varieties. These oils are renowned for their exceptional organoleptic characteristics and extremely high natural concentrations of polyphenols and other antioxidants.
- **Traditional Organic Cultivation Methods:** These methods have been handed down from antiquity, rooted in the traditions and heritage bestowed by ancestors. This deep knowledge and experience are passed from father to son.
- **Small Family Olive Estates:** The olive trees are nurtured with love, passion, and the utmost dedication on small family estates. The olives and olive oil produced are primarily consumed by the families themselves, ensuring top quality.
- **Climate and Soil:** The Mediterranean climate, with its warm, dry summers and mild, wet winters, provides ideal conditions for olive tree growth. The diverse soil types across Greece further contribute to the variety of flavors in Greek olive oils.
- **Harvesting:** Greek olive growers often harvest their olives by hand, selecting only the best fruits. This meticulous approach ensures that the olives are harvested at their peak of flavor and nutritional content.
- **Traditional Milling:** In Greece, many olive mills still blend traditional methods, like stone milling, with modern science and technology. This gentle process helps preserve the delicate fragrance and flavor of the olives, prioritizing top quality over quantity. It's noteworthy that over 85% of the olive oil produced annually in Greece is of the highest grade—Extra Virgin Olive Oil.

Basics of Olive Oil

Extra virgin olive oil (EVOO) is the **highest quality grade of olive oil**, produced through a detailed and delicate process that prioritizes quality over quantity. Unlike lower-grade olive oils, EVOO is obtained from the first cold pressing of olives, exclusively by mechanical means, without the use of heat or chemicals. This gentle extraction method preserves the oil's flavor, aroma, and potential health benefits.

Key Factors that Differentiate EVOO from Lower-Grade Oils:

A) Chemical analysis characteristics.

There are 4 vital parameters that distinguish a high premium EVOO from lower quality EVOOs and other oils. The acidity level, the peroxide value and the absorption in ultraviolet K232 & K270.

- **Acidity** in Olive Oil refers to the free fatty acid **(FFA)** content in the oil, expressed as the percentage of oleic acid.

It indicates how much of the fatty acids have broken away from triglycerides due to poor-quality olives, damage, or bad processing.

- **Peroxide value (PV)** remains the primary chemical indicator of **primary oxidation** and freshness in Extra Virgin Olive Oil (EVOO). It measures the concentration of hydroperoxides formed when unsaturated fatty acids react with oxygen.
- **UV absorbance** analysis is a standardized method used to assess the quality, purity, and authenticity of Extra Virgin Olive Oil (EVOO). It specifically detects primary and secondary oxidation products and can identify adulteration with refined oils

K232: Measures the presence of hydroperoxides (primary oxidation). High values indicate poor quality olives or improper storage.

K268/K270: Measures secondary oxidation products (aldehydes, ketones). High values are typical of refined oils or oil that has undergone advanced aging.
ΔK:A positive ΔK is a strong indicator of adulteration with refined olive oil or seed oils
The International Olive Council (IOC) has set the following global standards, for **EVOO**

- Free Acidity (FFA): **≤ 0.8%** (expressed as oleic acid).
- Peroxide Value: **≤ 20 meq O_2/kg** (indicates freshness/oxidation).
- UV Absorbance: Specific limits for K232, K270. Typical limits are **K270 ≤ 0.22** and **K232 ≤ 2.50.** refining/oxidation.
- **ΔK < 0.01**

The California Olive Oil Counsel (COOC) has set more strict requirements for **FFA ≤ 0.5 %** and Peroxide Level**s ≤ 15 meq O_2/kg.**
Very important to say that for Super Ultra Premium Quality EVOO the **(FFA): ≤ 0.3%** and Peroxide Value: **≤ 10 meq O_2/kg**

B) Sensory (Organoleptic) Attributes
An oil cannot be graded as EVOO by chemical tests alone; it must be evaluated by a certified Sensory Tasting Panel.

- **Median of Defects:** Must be 0. The oil must have no detectable flaws like rancidity, mustiness, or fustiness and many more.
- **Median of Fruitiness:** Must be > 0. The oil must exhibit a positive characteristic of fresh olives (aromas of grass, fruit, or herbs).
- **Bitterness and Pungency:** These are desirable traits indicating high polyphenol (antioxidant) content.

C) Polyphenols

Polyphenols are healthy compounds naturally found in certain plants. The compound offers a variety of antioxidant and anti-inflammatory properties and is categorized into flavonoids, phenolic acid, polyphenolic amides, and other polyphenols.

The major polyphenols in EVOO include oleocanthal, oleuropein, hydroxytyrosol, and tyrosol. They help protect the oil from oxidation, thus extending its shelf life and preserving its flavor and nutritional qualities. They also contribute to the oil's stability, health benefits, and sensory properties (bitterness and pungency).

Top 10 benefits of polyphenol rich olive oil

1. Lowers Blood Pressure

Unhealthy oils can raise your blood pressure and cholesterol levels, which can result in serious illness. EVOO combats this, which ncbi.nlm.nih.gov talks about in an article on the potential health benefits of olive oil and plant polyphenols.

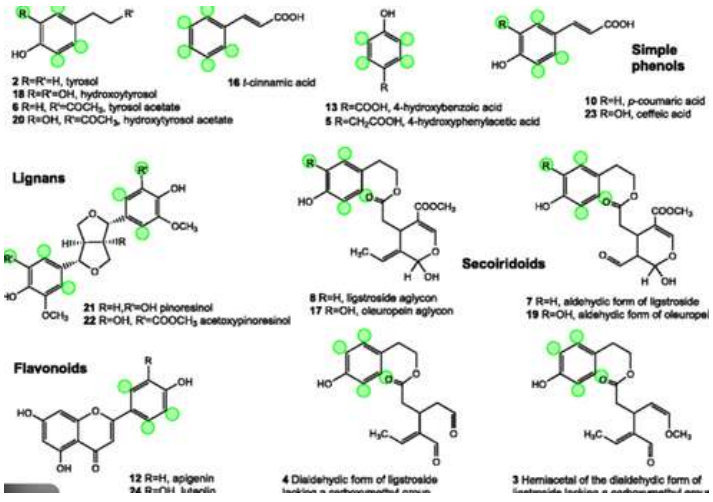

According to the source, both conventional and alternative medicine utilizes the power of olive oil and leaf extracts to treat health issues relating to blood pressure, like arterial hypertension and atherosclerosis..

Speaking of the heart, recent research shows that the polyphenols found in EVOO are significantly beneficial to cardiovascular health.

One study looked at the oil's anti-inflammatory and antioxidant effects in healthy adults, and the results showed that subjects experienced lower levels of inflammation following dedicated EVOO consumption – along with impressive antioxidizing effects.

Experts have spent decades studying the subject, and it turns out, some of the most powerful phenolic compounds go by the names of oleuropein and tyrosyl accordingly. Research shows that this can prevent certain cardiovascular risk factors, including hypertension, plasma lipid disorders, endothelial dysfunction, obesity, type 2 diabetes, and atherosclerosis.

The polyphenols found in EVOO have been shown to optimize circulating cholesterol as well as triglyceride levels, while reducing LDL oxidation. EVOO has also been shown to optimize glucose metabolism. Long story short, the benefits of polyphenol rich olive oil are obvious, and adding extra virgin olive oil to your daily diet is a no-brainer.

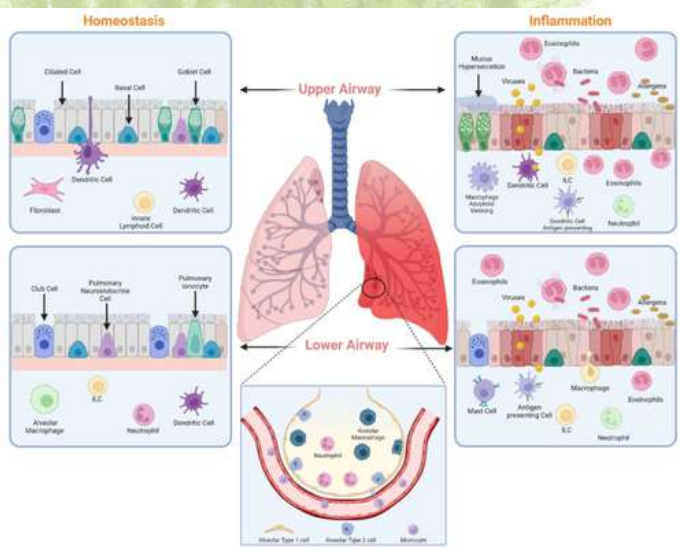

2. Boosts the Immune System

Healthy immunity is key to protection against inflammatory disorders and diseases like cancer. You can count on EVOO for an immunity boost, according to an article released by ncbi.nlm.nih.gov. The source speaks of numerous scientific studies which showcase the potential of polyphenols in modulating, regulating, and strengthening the human immune system.

3. Goodbye, Allergies

Enough sneezing, coughing, and spluttering.
EVOO's phenolic compounds fight allergies so you can enjoy lasting relief. ncbi.nlm.nih.gov's article speaks of polyphenol's tough anti-allergenic power.
Another article released by NIH explores polyphenol's influence on allergic immune reactions in more detail.
According to the source, dietary polyphenols – like the ones found in Extra Virgin Olive Oil – have been found to have a major impact on three common allergic diseases in humans.
These include asthma, food allergies, and eczema. Polyphenols prevent the development of allergies, which can significantly reduce symptomatic distress and improve the sufferer's life immensely.

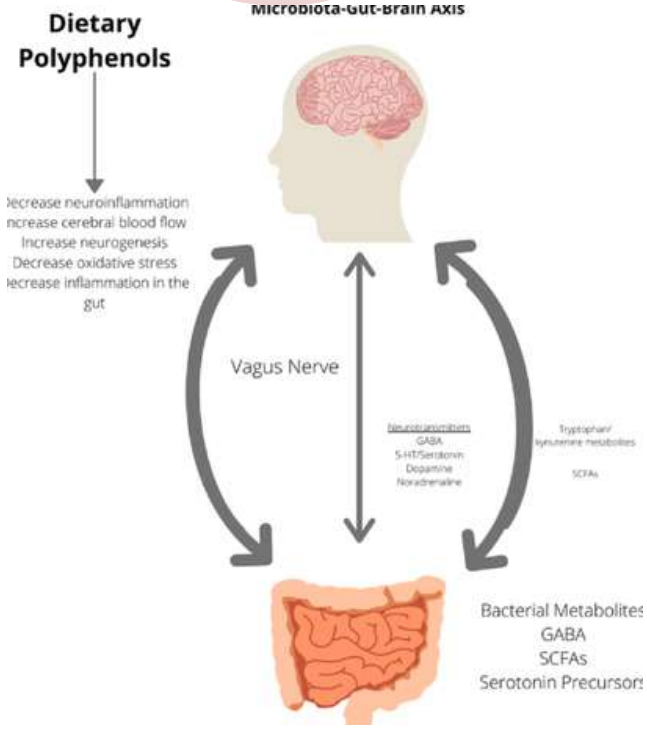

4. Mental Health

Numerous sources speak of the effect of polyphenolic compounds on mental health. According to Hindawi.com, these compounds – which are found in EVOO – have been found to prevent the development of neurodegenerative diseases like Alzheimer's and Dementia.
On a biological level, these polyphenolic compounds work to gradually improve the user's mental well-being by modulating and strengthening brain plasticity, cognition, mood, and behaviors. The source further hails polyphenols for their ability to combat and improve the symptoms of depression.
Frontiers In Neuroscience also explores the concept of how dietary polyphenols are closely connected to gut microbia, and how they can alleviate the signs of depression on a biological level.

5.Balanced Blood Sugar

Did you know that EVOO can actually lower your risk of developing Type 2 Diabetes? This oil boosts insulin effectiveness to balance blood sugar, according to WebMD. According to an article released by the medical journal, the rich antioxidants found in polyphenols have been found to potentially improve blood sugar in high-risk individuals who could develop conditions like diabetes and heart disease. According to the same source, the researchers of a particular study discovered that polyphenols work to improve blood sugar by improving the way in which the body actually metabolizes sugar.

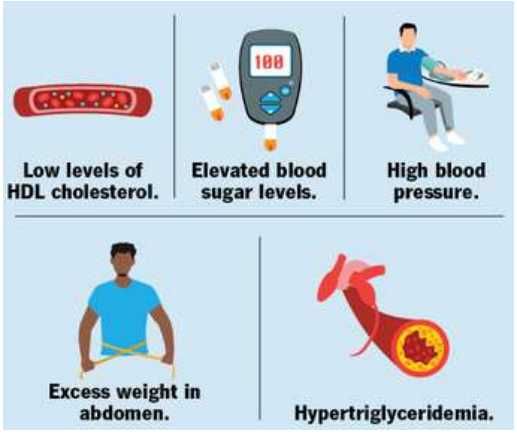

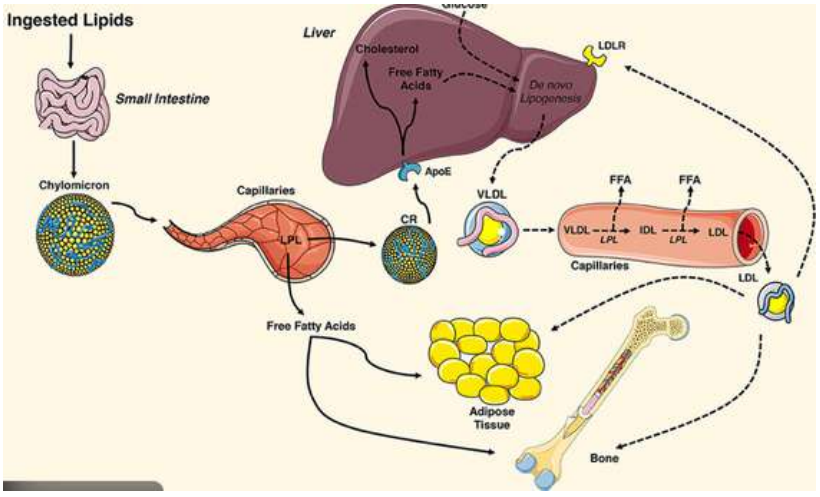

5.Balanced Blood Sugar

Recent research shows that the phenolic compounds in olive oil have a protective effect on red blood cells, coupled with protein stabilizing action. But one of the most interesting developments is the discovery of EVOO's role in easing the symptoms of metabolic syndrome (MS).
MS is becoming a growing health problem worldwide, affecting around 31% of the global population as we write this.
Sadly, this number is expected to rise to 50% of all human beings within the next 15 years. Thankfully, EVOO – coupled with a diligent Mediterranean diet – could have a positive influence. While there are many ways in which EVOO can improve MS symptoms, its ability to modify lipidic metabolism is one of them.

6.Healthy Weight

According to NCBI, polyphenols have been linked to the modulation of the body's molecular and physiological pathways.
In more simple terms, these pathways are responsible for metabolizing energy and controlling the onset of obesity. And by lowering your chance of gaining weight, you could in turn experience a reduced risk of developing many of the disorders that are commonly associated with obesity, such as diabetes and heart disease.
High concentrations of polyphenols – which are found in EVOO – have a strong antioxidizing effect on the body, which may also improve cognitive function and control the mental side of weight problems. According to the same NCBI article, polyphenols further suppress fat absorption from the gut while reducing chronic inflammation.

8. No More Inflammation

Inflammation can be painful, but EVOO can help with that - with its antioxidants that reduce swelling all over the body.
It's not necessarily the olive oil itself, but what's inside it, which is – once again – polyphenols. When it comes to inflammation, polyphenols are incredibly powerful. Once they're inside the body, they have been shown to regulate cellular activities within inflammatory cells, according to NCBI.
One of the most powerful polyphenols found in EVOO is Oleocanthal, which works in a similar way to ibuprofen – one of the most commonly prescribed drugs for inflammation in the world. According to Healthline, chronic inflammation is considered a leading cause of diseases like metabolic syndrome, Alzheimer's, arthritis, heart disease, cancer, and obesity. By consuming a little EVOO each day – making sure it's high-phenolic olive oil – you can enjoy the powerful anti-inflammatory impact of polyphenols.
According to scientists, 3.4 tablespoons, or 50ml, of Oleocanthal showcases a similar effect as 10% of Ibuprofen's adult dosage. Further research shows that olive oil's main fatty acid, oleic acid, holds the power to reduce the levels of certain crucial inflammatory markets found in the body, like C-reactive protein.

9. Better Digestion

EVOO contains something called “Sitosterol,” which regulates cholesterol absorption. In simple English, your digestion tract will be healthier than ever – and research proves it. According to Healthline, we can boost our digestion through regular consumption of polyphenols.

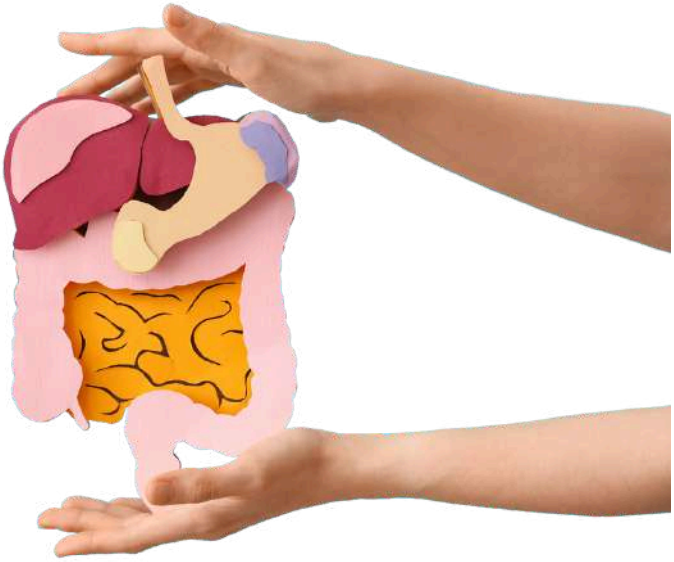

NCBI also hails polyphenols for their positive impact on the digestive tract, along with the liver. Medical News Today talks about how the fats in high-phenolic olive oil may smoothen the inside of your bowel, which makes it much easier for stools to pass through. This also boosts water retention in stools, which has been found to ease the pain of constipation.

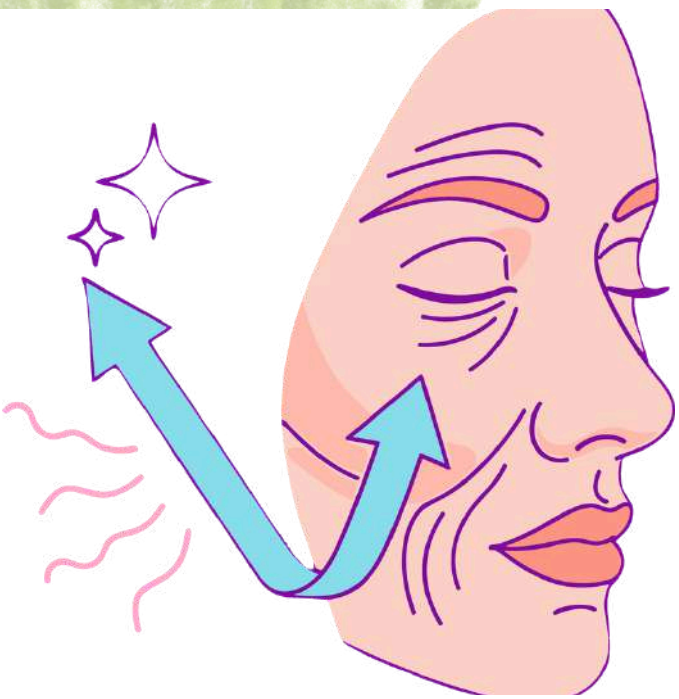

Experts suggest consuming a tablespoon of high-phenolic olive oil every morning, on an empty stomach, to relieve constipation. This is a tried and trusted wellness secret used by many healthy adults. Although, it’s important not to consume more than this to avoid cramps and diarrhea.

10. Overall Health Protection

The truth is olive oil has been used for hair, skin, and nails since ancient times. Naturally, olive oil is packed with valuable anti-aging antioxidants and hydrating factors, making it ideal for body use.

Honestly, there are so many benefits to consuming high-phenolic extra virgin olive oil, we’d be here all day if we were to list them all. The fact that it’s so delicious is a bonus!

Bonus – Improves Athletic Performance Naturally

Extra Virgin Olive Oil has been used by athletes for centuries to improve their performance naturally. Even today, thousands of athletes all over the world use EVOO's polyphenols to enhance their performance. Polyphenols work by reducing oxidative damage and cholesterol levels, strengthening the heart, building stronger bones, and increasing energy levels.
This makes Extra Virgin Olive Oil the perfect choice for athletes looking to improve their performance naturally.

- Premium EVOO typically contains polyphenol levels above 300 mg/kg.

From the Olive Tree Farm to your Table

a) Cultivation

Variety Selection: FAOS carefully selects olive cultivars renowned for their high polyphenol content. These varieties are prized for producing oils with exceptional flavor profiles and potential health benefits.
Organic and Biodynamic Practices: FAOS adheres strictly to organic and biodynamic farming methods, avoiding synthetic pesticides, herbicides, and fertilizers. This promotes healthier soil, greater biodiversity, and enhances the natural growth of olive trees. The result is olives with a higher nutritional value, enriched with more antioxidants and polyphenols. These practices and their benefits are verified by independent international certifying bodies and numerous globally recognized labs.

Optimal Growing Conditions: FAOS selects olive trees located at mid to high altitudes, which benefit from cooler temperatures and increased sunlight, enhancing flavor complexity and the concentration of beneficial compounds. The groves feature high natural drainage, advanced water management, and special subsoil composition, all contributing to the olives' quality. Adequate spacing between trees ensures better air circulation, reducing fungal disease risks and improving overall fruit quality.

b) Harvesting

Early and Selective Harvesting: Olives are picked very early and selectively according to the ripeness of each tree, when they have reached optimal levels of polyphenols among other valuable compounds.

Immediate Processing: Prioritizing freshness and preventing oxidation, the harvested olives are swiftly transported to the mill within hours to preserve the delicate flavors and nutritional value of the oil.

C) Extraction

Cold Pressing: FAOS employs traditional cold pressing techniques to extract the oil, solely by mechanical means. This gentle method involves gradually increasing pressure to release the oil from the fruit, without the use of heat, water, additives or chemical solvents.

Optimal Paste Conditions: Ensuring the olive paste is protected from heat, air, light, and moisture throughout processing. Constant monitoring and meticulous care are applied to prevent oxidation, which can degrade the organoleptic qualities and destroy the natural antioxidants in the olive oil. This careful management preserves the integrity and health benefits of the oil

d) Processing

Zero Processing: This EVOO is unrefined, unbleached, unfiltered, and undeodorized to preserve its natural characteristics and antioxidants, ensuring the oil's purity and integrity without causing organoleptic defects.
Rigorous Quality Control: FAOS maintains the highest standards of quality control, conducting sensory analyses, chemical testing, and physical tests to ensure oil quality. The oil is also certified by numerous internationally recognized labs and independent certifying bodies.

e) Bottling and Storage

Natural Sedimentation: After extraction, it is allowed to settle naturally in stainless steel tanks rather than being filtered. This process lets sediments separate slowly, preserving the oil's clarity, flavor, and high concentration of beneficial antioxidants and nutrients.
UV-Protected Sophisticated Bottling: FAOS is bottled in dark, UV-protected containers to guard against light-induced degradation and extend shelf life. The oil is also bottled using vacuum filling machines to eliminate air exposure, further protecting its quality.
Temperature-Controlled Storage: The oil is stored in a cool, dark environment to prevent oxidation and deterioration before it is packaged and sold.

Adulteration and the The Real World

As we've established, not all olive oils are created equal.
While many commercial brands may be labeled as "extra virgin," their quality can vary significantly. To truly reap the health benefits and culinary delights of olive oil, it is essential to seek out high-quality, extra virgin olive oil, particularly those rich in polyphenols.
FAOS, a brand committed to producing the finest extra virgin olive oil, exemplifies this pursuit of excellence.
By adhering to traditional methods and employing duteous techniques, FAOS ensures that its EVOO is rich in taste, color, aroma, and health-promoting compounds.

A CLOSER LOOK AT OLIVE OIL PURITY

A common misconception is that all olive oil is **purely** derived from olives.
While high-quality extra virgin olive oil is indeed produced solely from olives, the olive oil market is unfortunately rife with adulteration.

The Problem of Adulteration and of lower grade olive oils labels as EVOO
Adulteration involves the mixing of olive oil with cheaper oils, such as soybean, sunflower, or palm oil.
This practice is widespread and can significantly diminish the quality and health benefits of olive oil.
Just because a bottle says "olive oil" doesn't mean it's giving you all the benefits. The truth is, the olive oil industry has a transparency problem. Many supermarket bottles that claim to be the healthiest oil to cook with are, in fact, blended with cheaper oils, refined, or stored in ways that degrade quality before you ever open the cap. Even the term "extra virgin" isn't always enforced.

A recent study found that nearly 70% of imported EVOO on grocery store shelves didn't meet basic purity standards.

˚You've probably seen it for yourself... "OLIVE OILS" screaming in all-caps, with something along the lines of "blended with seed oils" in tiny, near-illegible text underneath.
Classic marketing trickery.
The difference between a true, cold-pressed, high-polyphenol olive oil – and its mass-produced counterpart that's marketed to look healthy – isn't just about taste. It's about whether or not you're getting the actual antioxidant and anti-inflammatory properties you came for.
You deserve to know what you're putting in your body, and when you're looking into olive oil vs seed oil for health reasons, that clarity matters now more than ever before.

Check the Label: Look for certifications from reputable organizations like the International Olive Council (IOC). These certifications ensure that the oil meets specific quality standards.
Sensory Evaluation: Taste, smell, and appearance can provide clues. High-quality olive oil should have a fruity aroma, a peppery taste, and a golden-green color.
Purchase from Reputable Sources: Buy olive oil from trusted brands like FAOS or specialty stores that prioritize quality.
Storage Matters: Once purchased, it's essential to store your olive oil in a cool, dark place to preserve its flavor and nutritional value.

...And now is the time to introduce you to the magical world of our EVOOs...

...And now is the time to introduce you to the magical world of our EVOOs...

As of now we are cultivating and producing two major olive oil varieties, Koroneiki and Athenolia. At the end of 2026 we will also add Manaki variety in our selection.

And now is the time to introduce you to the magical world of our EVOOs...

As of now we are cultivating and producing two major olive oil varieties, Koroneiki and Athenolia. At the end of 2026 we will also add Manaki variety in our selection.

KORONEIKI VARIETY

Product Description: 100% Pure & Natural, Organic, Extra Virgin Olive Oil (EVOO)
Originated from: At the altitudes of Korinthos highlands, near Ancient Nemea in Peloponnese, Greece

Variety: KORONEIKI
Cultivation: Certified Organic
Harvest: Early (Late October)
Extraction: Cold Extraction (Temperature below 25 °C), within 12 hours from harvest. No heat or water involved
Chemical Analysis Characteristics: Free Acidity (FFA) ≤ 0.30 (max 0.80)
Peroxide Value ≤ 7.5
K232 ≤ 1.97
K268 ≤ 0.16
ΔK ≤ 0.00

Organoleptic characteristics: Mild Intensity, Bitter & Spicy taste, with great notes of fruitiness, admirable golden-green color and perfect texture

Polyphenols: 800+ mg/kg
(**mg/kg** of HT, T and their derivatives by **HPLC method of measurement)**

Recommended Daily Intake (RDI): 4 imperial teaspoons (24 ml)

ATHENOLIA VARIETY

Product Description: 100% Pure & Natural, Organic, Extra Virgin Olive Oil (EVOO)
Originated from: At the altitudes of Korinthos highlands, near Ancient Nemea in Peloponnese, Greece

Variety: Athenolia
Cultivation: Certified Organic
Harvest: Early (Late October)
Extraction: Cold Extraction (Temperature below 25 ℃), within 12 hours from harvest. No heat or water involved
Chemical Analysis Characteristics: Free Acidity **(FFA) ≤ 0.27 (max 0.80)**
Peroxide Value ≤ 12.2
K232 ≤ 1.92
K268 ≤ 0.15
ΔK ≤ 0.00

Organoleptic characteristics: Light Intensity, slightly Bitter, with great notes of fruitiness,astringent and pungent note with sweetness, admirable golden-green color and perfect texture.

Polyphenols: 400+ mg/kg
(**mg/kg** of HT, T and their derivatives by HPLC method of measurement)

Recommended Daily Intake (RDI): 4 imperial teaspoons (24 ml)

น้ำผึ้งของ FAOS

Honey is a natural sweetener primarily produced by bees (Apis mellifera) from plant nectar or insect secretions. Beyond its use as a sweetener, honey has a long history of over 8,000 years as a medicine and preservative. In ancient Greece, honey (meli) was considered a gift from the gods, serving as a primary sweetener, a versatile medicine, and an essential component of the religious and medical life of ancient Greek physicians. Hippocrates, the "father of medicine," particularly considered honey a cure-all for various ailments.

HONEY
BASICS OF HONEY

The origin of Honey

NECTAR & HONEYDEW (sap)
(carbohydrates ≥90% d.s.)

NECTAR:
Water
- Sugars (≥90% d.s.)
- Minerals
- Organic acids
- Pigments
- Vitamins
- Enzymes
- Aromatic substances
- N-based substances

HONEYDEW: Water (82-95%)
Sugars (90-95% of dry sub.)
N-based substances
Minerals (Salts)
Organic Acids
Long Chain Alcohols
Enzymes
Vitamins

Nectar production might be influenced by **internal** factors:
plant species
- flower size
- nectary surface
- age and condition of flowers
- plant health

...and **external** factors :

ส่วนผสมบริสุทธิ์และเป็นธรรมชาติ

• environmental & climatic conditions (temperature – sunshine - wind - relative humidity – nature of the soil – soil humidity)
• use of fertilizers & minerals

HONEYDEW
Piercing and sucking insects
Aphids can extract sap (the sweet, sticky liquid excreted by sap-sucking insects (aphids, scale insects, or cicadas) after they feed on plant sap, essentially being excess sugar-water they can't digest directly from tree branches and leaves, since they can drill into the bark of the plant.

They filter to get minerals and amino acids, and release most of the sugar content.

Honeydew production can be influenced by:

- botanical species & cultivation
- environmental & climatic factors
- development of the aphid population

1. Nectar or Honeydew Collection

Foraging worker bees fly from flower to flower, using their straw-like tongues (proboscises) to drink nectar or honeydew, a sugary liquid. This nectar is stored in a specialized "honey stomach" (crop). While in this stomach, enzymes like invertase begin breaking down complex sugars (sucrose) into simpler ones (glucose and fructose)

2. The Handover and Digestion

When the forager returns to the hive, she regurgitates the nectar and passes it to "house bees" mouth-to-mouth. These bees continue to chew and swallow the nectar for about 30 minutes, further mixing it with enzymes that raise its acidity and prevent bacterial growth.

3. Evaporation and Ripening

The partially processed nectar is deposited into hexagonal honeycomb cells. At this stage, it still contains up to 80% water. To thicken it into honey, bees perform two actions:

- Fanning: They rapidly flap their wings to create a warm breeze across the comb, accelerating water evaporation.
- Bubbling: Bees may also blow bubbles between their mandibles to increase the surface area of the liquid for faster drying.

4. Storage and Capping

Once the water content drops to approximately 17%, the nectar has officially become honey. Because of its high sugar concentration and low moisture, it is naturally resistant to mold and bacteria. The bees then seal the cell with a beeswax cap to keep it airtight and fresh for later use, especially during winter months.

5. FAOS QUALITY PRODUCTION

Phase A: Bee & Apiary Management

1. Apiary Location: Site hives in areas with diverse, clean floral sources (organic preferred) to ensure unique flavor profiles . Some of the locations that we transfer our hives are
2. Bee Health: Maintain healthy colonies by managing pests/diseases naturally and providing supplementary feeding only when necessary (during the winter).
3. Hive Quality: Use natural, untreated materials (wood, clay) for hives to avoid chemical contamination.

Phase B: Harvesting

1. Timing: Harvest only ripe honeycombs, identified by their wax cappings, which indicates low moisture content.
2. Gentle Removal: Use bee brushes or clearing boards to gently remove bees from frames, disturbing the colony minimally.

Phase C: Extraction & Processing

1. Uncapping: Carefully remove the wax cappings from the honeycombs.
2. Cold Extraction: Use a centrifuge to spin honey out of the frames without applying heat, preserving enzymes and nutrients.
3. Minimal Filtration: Lightly filter to remove large wax pieces and debris, but avoid fine filtration to keep pollen and natural elements in.
4. No Heat: Do not heat the honey in order to maintain flavor and health benefits, as heat destroys enzymes.
5. Gentle Jarring: Slowly warm honey just enough to help it flow into jars for bottling, only if needed.

Phase 5: Quality & Packaging

1. Traceability: Ensure transparency in origin (floral source, location) for verifiable quality.
2. Labelling: Clearly label with origin, organic status (certified), and ensure no added sugars or any other substances.
3. Natural Crystallization: Allow honey to crystallize naturally, as it's a sign of authenticity and minimal processing.

The myth of crystallization :
Crystallization in honey is a natural process where glucose separates from water, forming sugar crystals, turning liquid honey thick, cloudy, or solid, and is a sign of **purity**, not spoilage.

Higher ratio of glucose to fructose (or lower fructose/glucose ratio, F/G < 1.0) leads to faster crystallization in honey, as glucose crystallizes more readily than fructose; conversely, a higher fructose content (F/G ratio > 1.0) results in slower crystallization, keeping the honey liquid longer. This is because glucose is less soluble in water, forming crystals more easily, while the higher solubility of fructose keeps it in solution, slowing the overall process.

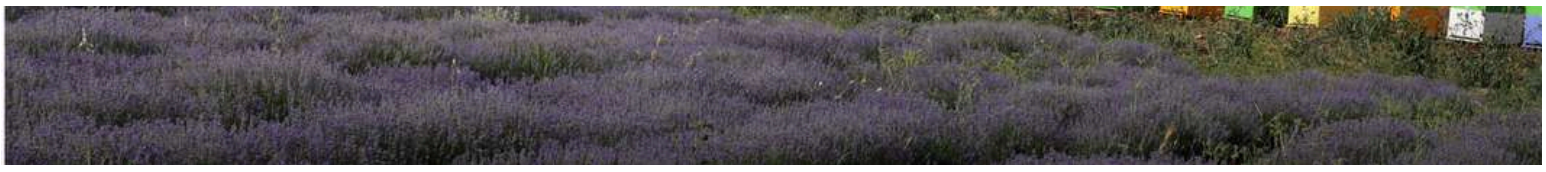

SO, that's why honeydew honeys don't crystallize as much or in some cases at all (fir, chestnut honeys) like nectar made honeys.

Key Factors that Differentiate premium honeys from Lower-Grade honeys:

A) Chemical analysis characteristics

Chemical analysis of honey involves assessing its physicochemical parameters to determine quality, botanical origin, and purity. These characteristics are heavily influenced by botanical source, geographical location, climate, and processing methods.

a) **HMF** Hydroxymethylfurfural (HMF) analysis is a critical laboratory procedure used as a primary indicator of honey freshness, quality, and thermal history. **High Premium honeys typically contain very low levels of HMF (under 15 mg/kg)**, but concentrations increase significantly when honey is overheated during processing or stored for extended periods.
IHC (International Honey Commission) sets the limit at **≤40mg/kg**
All FAOS premium honeys shows HMF ≤12mg/kg

b) A **glucose and fructose analysis** in honey is primarily used to verify authenticity, detect adulteration, and predict crystallization.
A fructose/glucose ratio > 1 (often ~1.2:1) suggests natural honey, while a lower ratio can signal adulteration with cheaper syrups.
IHC (International Honey Commission) sets the limit at **>60%**

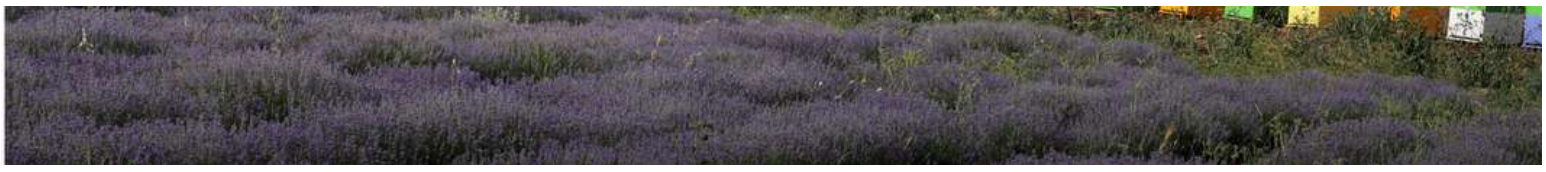

c) **MOISTURE ANALYSIS** in honey is a critical quality control measure because water content directly affects honey's shelf life, stability, and resistance to fermentation.
According to IHC the standard legal limit for moisture in general honey is **20%** or less; levels above this threshold significantly increase the risk of spoilage by yeast fermentation.
All FAOS premium honeys shows moisture levels ≤17%

d) **Electrical conductivity (EC)** analysis in honey measures its ability to conduct electricity, a key quality control tool for determining botanical origin, purity, and authenticity, as it reflects mineral, acid, and protein content, with dark honeydew honeys having higher EC (>0.8 mS/cm) than most floral honeys (<0.8 mS/cm).
All FAOS premium honeys show EC (based on the variety) much less or above the requirements!

e) **Diastase activity (DN)** analysis in honey measures the amount of amylase enzymes, indicating freshness, quality, and authenticity by detecting heat damage or adulteration, as high activity means fresh honey while low activity suggests processing or age.
IHC (International Honey Commission) requiring minimum levels at **≥8**
For some varieties like chestnut the minimum level is at **≥1.1**

f) **Free acidity** in honey is a critical quality parameter that reflects its organic acid composition and serves as an indicator of freshness and botanical origin.
The Codex Alimentarius, IHC and EU standards set a maximum free acidity **≤50 milliequivalents (meq/kg)** for most honeys.

g) **All FAOS premium honeys have a pesticides free and veterinary drugs free chemical analysis !**

B) Sensory (Organoleptic) Analysis

Sensory organoleptic honey analysis is the scientific evaluation of honey's quality, authenticity, and botanical origin using human senses (sight, smell, taste, touch) to assess attributes like color, aroma, flavor, and texture, complementing chemical tests by detecting subtle defects (fermentation, impurities) or defining varietal profiles, crucial for quality control, consumer perception, and adherence to standards.

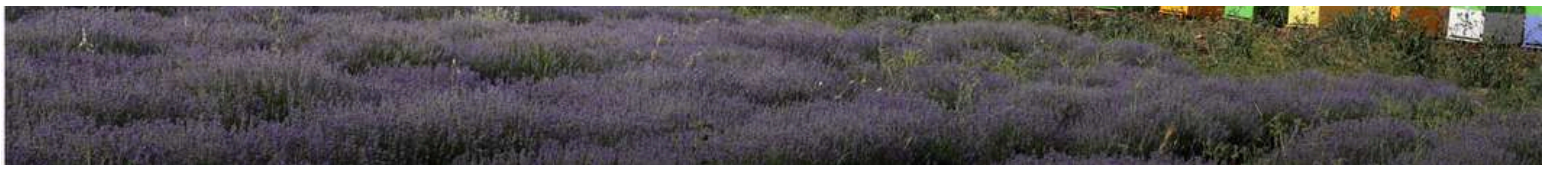

Key Aspects of Sensory Analysis

- Visual (Appearance/Color): Assess clarity, color intensity (e.g., light vs. dark), and crystallization, which relates to sugar composition (fructose/glucose ratio).
- Olfactory (Aroma): Detect specific floral notes, fruity hints, or undesirable odors like fermentation or smoke.
- Gustatory (Taste/Flavor): Evaluate sweetness, acidity, bitterness (phenolic compounds), and characteristic flavors linked to the nectar source.
- Tactile/Texture (Mouthfeel): Analyze consistency (viscosity, graininess), smoothness, and the effect of sugar spectrum on firmness.

Purpose & Importance

- Quality Control: Identifies spoilage, adulteration (e.g., added sugars, water), and fermentation issues not always caught by lab tests.
- Botanical Classification: Helps confirm if honey matches its stated floral source (e.g., clover, eucalyptus) by characterizing its unique sensory fingerprint.
- Consumer Preference: Understands what attributes (flavor, color, texture) drive consumer acceptance.
- Standards Compliance: Ensures products meet specifications for varietal honeys, as noted by regulatory bodies like the Italian Register of Experts in Sensory Analysis of Honey.

Nikolaos Basoukos is a certified honey sommelier through Bee Sources.

1. Rich in antioxidants

Minimally-processed honey contains many important bioactive plant compounds and antioxidants, such as flavonoids and phenolic acids. Darker varieties tend to offer more antioxidants than lighter varieties.There have been numerous lab studies showing fresh and unprocessed Greek honeys are very high in total phenolic content and antioxidant activity.

2.Better for blood sugar levels than regular sugar

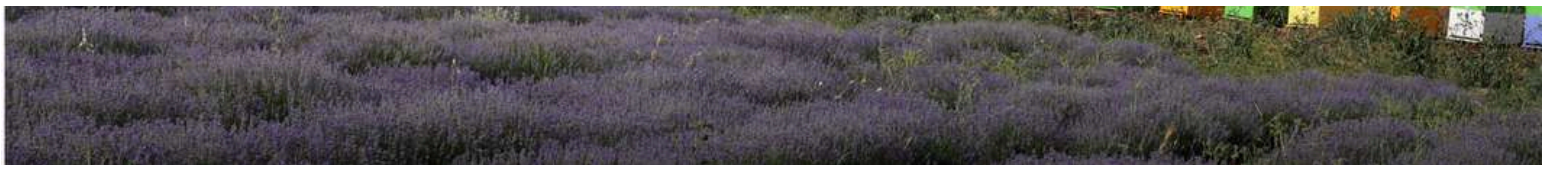

Researchers have found that honey may increase adiponectin levels, a hormone that reduces inflammation and improves blood sugar regulation. There's also evidence that daily honey intake may improve fasting blood sugar levels in people with type 2 diabetes.

3.May improve heart health

Honey may also help prevent heart disease. According to one review, honey may help lower blood pressure, improve blood fat levels, regulate your heartbeat, and prevent the death of healthy cells — all factors that can improve your heart function and health.

One observational study, including over 4,500 people over 40 associated a moderate honey intake with a lower risk of high blood pressure among women. A rodent study also showed that honey helped protect the heart from oxidative stress

Additionally, raw honey typically contains propolis, a resin that bees produce from sap-producing trees and similar plants. Propolis may improve cholesterol and triglyceride levels

4. **Promotes burn and wound healing**

There is a historical precedent for the use of topical honey treatment for wound and burn healing. The practice is still common today.
A review of 26 studies on honey and wound care found it most effective at healing partial-thickness burns and wounds that have become infected after surgery.

5.May help suppress coughing in children

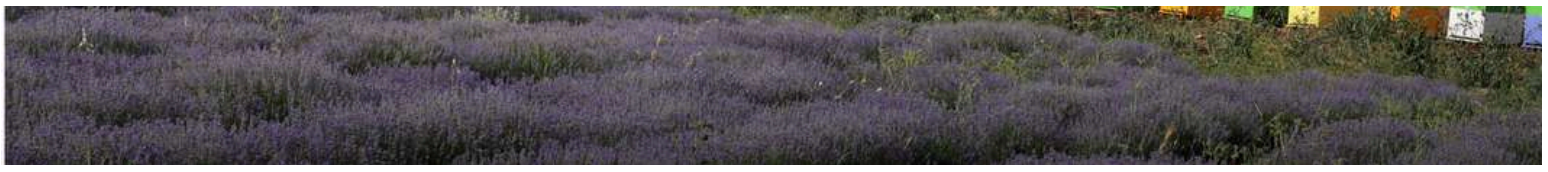

Coughing is a common problem for children with upper respiratory infections. These infections can affect sleep and quality of life for children and parents.

One review of several studies on honey and cough in children found that honey appears more effective than diphenhydramine for cough symptoms. It may also help reduce cough duration.

Another review noted that it may also improve sleep quality among children with coughs, as well as their parents. Further, unlike some cough medicines, honey doesn't have any side effects.

6. Easy to add to your diet

Honey is often easy to add to your diet. To get a small boost of antioxidants from honey, you can use it any way you'd typically use sugar. It's excellent for sweetening plain yogurt, coffee, or tea. You can also use it in cooking and baking.

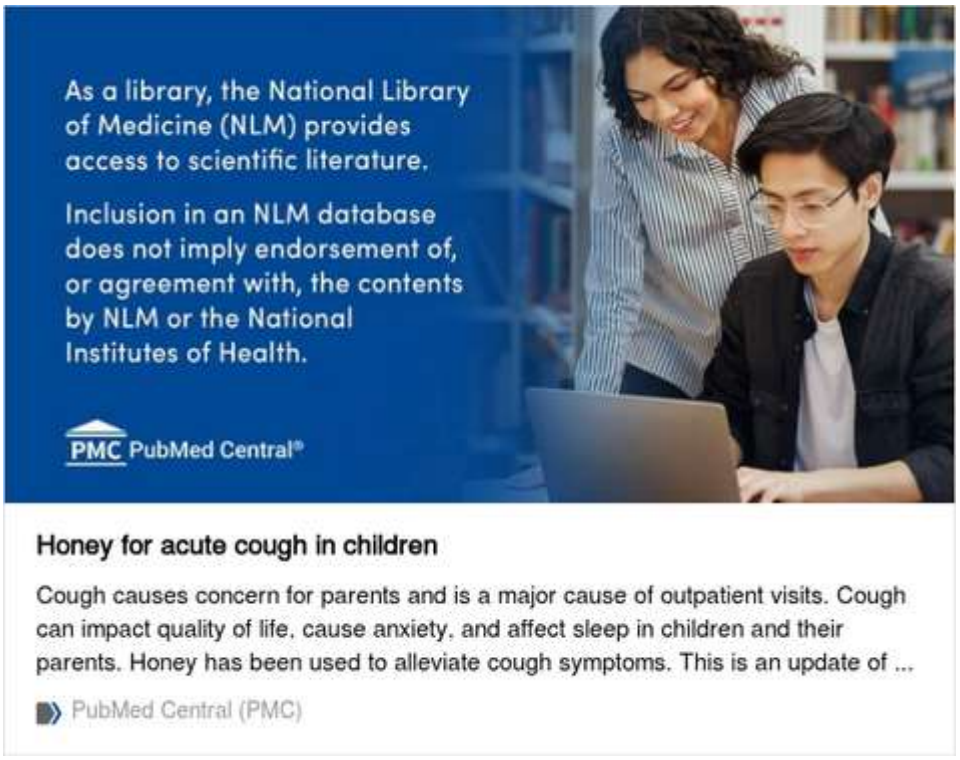

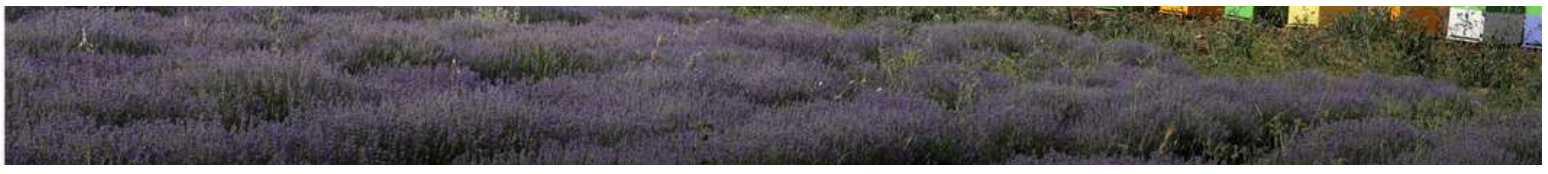

Major Findings & Studies

●EU Coordinated Action (2021–2022): An EU-wide testing campaign titled "From the Hives" sampled 320 honey consignments imported into Europe. The study, which involved laboratories and samples from Germany, found that 46% of samples were suspicious of adulteration with extraneous sugars.

●2020 CSE Investigation: A high-profile study by India's Centre for Science and Environment (CSE) sent samples from top Indian brands to a specialized German laboratory for Nuclear Magnetic Resonance (NMR) testing. The German tests revealed that 77% of the samples were adulterated with sugar syrup, despite many having passed standard Indian laboratory tests.

●UK Supermarket Study: A 2020 investigation into UK supermarket honey utilized a leading German laboratory which found 8 out of 9 samples were non-compliant with authenticity standards.

...And now is the time to introduce you to the magical world of our premium honeys...
As of now we are harvesting and producing seven major honey varieties:

- Orange Blossom Honey
- Organic Pine Honey
- Organic Fir Honey
- Organic “Pearl” Fir Honey
- Organic Thyme Honey
- Organic Oak & Forest Honey
- Organic Chestnut Honey

. At the end of 2026 we will also add Strawberry Tree (Arbutus) and Heather varieties in our selection.

ORANGE BLOSSOM HONEY

This highly aromatic honey is collected from our bees in the organic orange groves at Velo-Vocha in Corinthia and in Argos.

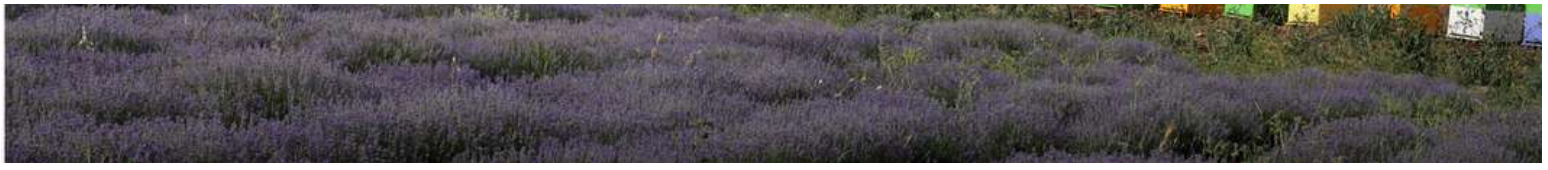

ATTRIBUTE	SENSORY PROFILE
Colour (Pfund) :	Golden white to extra light amber (0–50 mm)
Aroma :	Floral, fresh, orange blossom flower, zesty undertones
Taste :	Refreshing sweetness, citrusy, aromatic
Texture :	Due to a high glucose-to-fructose ratio crystallizes must faster, can be creamy or coarse sandy

PINE TREE HONEY

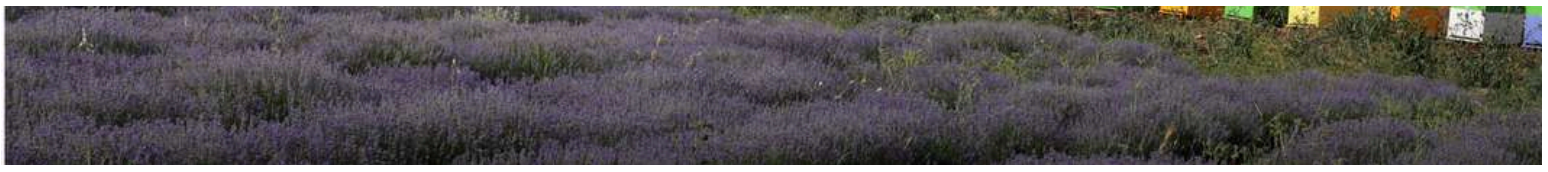

Pine tree honey is produced by our bees mainly in the area of Kamarisa in Northern Evia and occasionally in the pine forest of Mountainous Tripoli. This is the most abundant honey in Greece with many loyal fans. Dark brown in color with a mild sweet taste and a velvety light texture. It is probably the ideal honey for your sweets…

ATTRIBUTE	SENSORY PROFILE
Color (Pfund):	Deep amber to reddish-brown, often exhibiting a pearl shine.
Aroma:	A complex, woody, and resinous fragrance.
Taste:	With savory and spicy notes, often with hints of toasted pine nuts or caramel.
Texture:	Thick and smooth with a creamy mouthfeel. It remains fluid for a long Time (frequently exceeding 18 months) due to low glucose and moisture content

OAK TREE & FOREST HONEY

This unique honey, rich in antioxidants, is collected from our bees in the virgin oak forests of Parnonas mountains in Arcadia & Foloi mountains in Ilia.

ATTRIBUTE SENSORY PROFILE

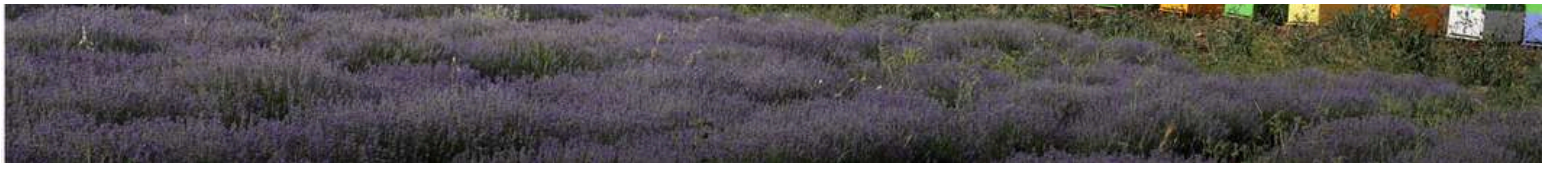

Color (Pfund): Deep amber to nearly black; almost opaque and strikingly dark. (140mm)
Aroma: Complex notes of wood, damp forest floor, and dark dried fruits, with whispers of smoke.
Taste: Less sweet than nectar honeys; features notes of molasses, roasted nuts, and bitter chocolate.
Texture: Thick and molasses like texture. During winter time it might get caramelized like texture.

- **Research published in ResearchGate indicates it has one of the highest antioxidant profiles among Greek honeys.**

FIR HONEY

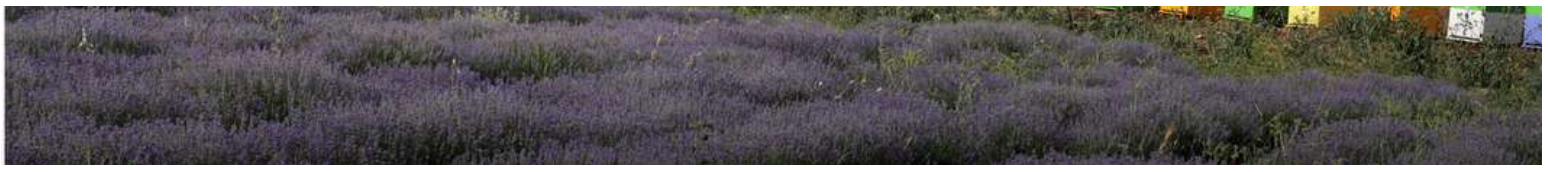

The “red” Fir honey is produced by our beehives in Mountainous Arcadia, at altitudes of 1100 meters or more at Korinthos and Parnonas mountains. One of the finest and rarest varieties of the Greek land, created from honeydew.

ATTRIBUTE SENSORY PROFILE

Color (Pfund): Light brown-red to mild darker, with shades of pearl. (60mm-90mm)
Aroma: Fir honey has a distinctive, complex profile. Sensory evaluations often identify
n notes of wood, resin, and wax, alongside a chemical or herbal aroma.
Taste: It offers a mild nuttiness and sweetness compared to blossom honeys, with savory herbs or hints of molasses and fig jam.
Texture: Mild thickness. Due to its low moisture and low glucose and fructose sum, it remains fluid for a long time and exhibits a very slow crystallization rate.

“PEARL” FIR TREE HONEY

Fir tree honey (Abies cephalonica) is the rarest honey in Greece and **one of the rarest in the world**. This honey is gathered by our bees at the Mountains of Vytina ,Mainalos in Arcadia.

ATTRIBUTE SENSORY PROFILE

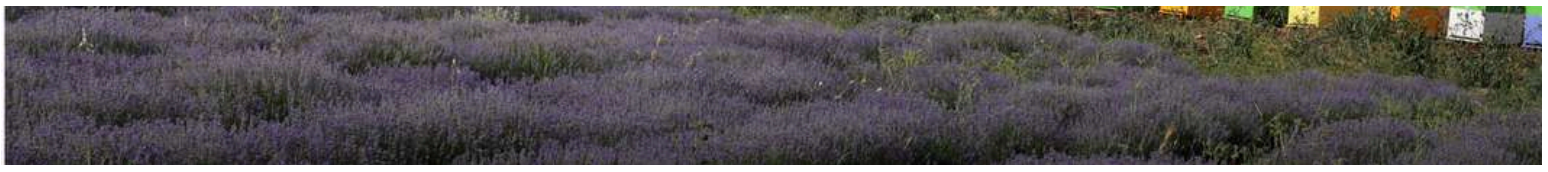

Color (Pfund): Light, pearly white amber, almost opalescent with a glossy sheen, giving it the "vanilla", “pearl” name.
Aroma: Deep, gentle; notes of warm wood, damp earth, faint vanilla, and creamy caramel.
Taste: Mild, not overly sweet, full-bodied with a clear, sophisticated, lingering finish.
Texture: Thick, slow-flowing, satin-like; resists crystallization well.

-VERY UNIQUE HOMEY, ONE OF THE RAREST HONEYS IN THE WORLD

THYME HONEY

Our thyme honey is produced by our bees, in the mountainous area of Voies in Lakonia's Agia Marina and in the Southern part of Evoia.

ATTRIBUTES SENSORY PROFILE

Color (Pfund): Ranges from light amber to dark orange; can lighten upon crystallization.
Aroma: Intense, floral, with woody, resinous, or waxy notes; higher pollen content often means stronger floral/woody scents.
Taste: Sweet, sometimes with a lingering spicy/salty sensation or slight burning feel, can have hints of bitter almond, lilac, or rose.

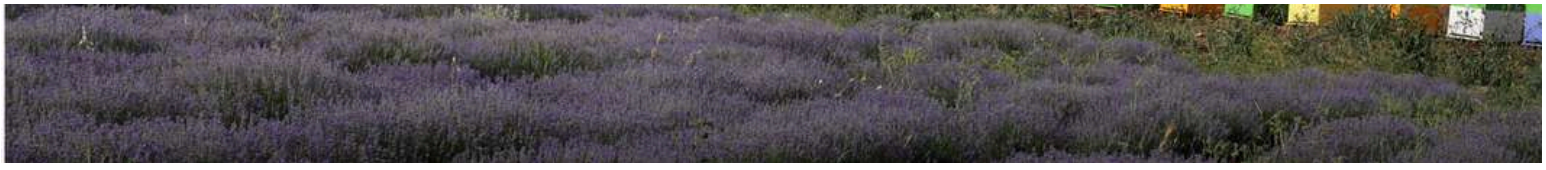

Texture: Usually is fluid smoothly but sometimes can crystallize quickly into fine crystals.

ORGANIC CHESTNUT HONEY

This exceptional honey is produced at the famous Mount Athos in Northern Greece. Its proven that its total phenolic level is one of the highest among all the honeys.

ATTRIBUTES SENSORY PROFILE

Color (Pfund): Typically dark golden-brown to dark amber with a reddish tint.
Aroma: Is extremely aromatic and intense. It has a very distinctive aroma with notes described as: woody, spicy, earthy.
Taste: A unique complexity, as it features a strong, slightly bitter taste with a persistent, lingering finish in the mouth and burnt caramel or even smoky, leathery quality.
Texture: A thick, sometimes caramelized texture, the high fructose content means it remains in a liquid consistency and crystallizes extremely slowly.
